HAITI DIGITAL TRANSFORMATION INITIATIVE

CANON v1.0

Building Haiti's Digital Public Infrastructure

Project Status	Foundational Vision
Version	1.0
Initiated by	TechKlein
Founder	Erickharlein Pierre

One Nation. One Trusted Identity. Connected Public Services.

Republic of Haiti

1. Canon Statement

The Haiti Digital Transformation Initiative is a long-term national development vision designed to establish the digital infrastructure, public-service platforms, data standards, and institutional capabilities required for a modern Haitian state.

The initiative proposes a secure and interconnected digital ecosystem through which citizens, government institutions, municipalities, businesses, educational organizations, healthcare providers, cultural institutions, the diaspora, and authorized development partners can access and exchange services.

Its purpose is not merely to create a government website. Its purpose is to build the digital foundation through which Haiti can identify its citizens, deliver public services, manage national information, strengthen institutions, preserve its culture, expand economic participation, improve transparency, and connect the country with the Haitian diaspora and the world.

The initiative will be developed as a collection of interoperable platforms governed by common standards, secure digital identity, controlled data exchange, strong privacy protections, and institutional accountability.

2. Master Vision

Vision

A digitally connected Haiti in which every citizen can securely access public services, every government institution can collaborate through trusted systems, every department and commune can be represented digitally, and Haiti's culture, history, geography, and economic opportunities can be experienced by the world.

Mission

To design and build secure, inclusive, resilient, and interoperable digital public infrastructure that improves government services, strengthens public institutions, protects national data, supports economic development, and expands access to opportunity for all Haitians.

National Promise

One Nation. One Trusted Identity. Connected Public Services.

3. Strategic Purpose

The initiative is intended to address structural challenges including:

- Fragmented government information systems
- Paper-based administrative processes
- Limited access to public services outside major cities
- Inconsistent citizen and business records

- Weak interoperability among government institutions
- Limited transparency in public administration
- Insufficient national geographic and statistical information
- Limited digital access for the diaspora
- Underrepresentation of Haitian history, culture, and local communities online
- Dependency on external platforms to define Haiti's digital image
- Inadequate digital continuity during disasters, crises, or political transitions

The initiative establishes a framework through which these challenges can be addressed progressively rather than through one oversized implementation.

4. Core Principles

4.1 Citizen First

Government technology must be designed around the needs of citizens rather than around institutional bureaucracy. Citizens should not be required to repeatedly provide the same information when secure and lawful verification is possible.

4.2 Digital Inclusion

Public services must remain accessible to people with limited internet access, limited digital literacy, disabilities, or no personal computing device. Digital transformation should improve physical service centers, not eliminate them.

4.3 Privacy by Design

Personal data must be collected only for lawful and clearly defined purposes. Access must be limited, monitored, auditable, and based on institutional responsibility.

4.4 Security by Design

Cybersecurity must be incorporated into every platform, API, database, identity system, application, and administrative workflow from the beginning.

4.5 Interoperability

Government institutions must be able to exchange authorized information through common technical and data standards.

4.6 Institutional Independence

Each ministry, agency, department, and commune may operate its own services while connecting securely to shared national infrastructure.

4.7 Transparency and Accountability

Citizens should have access to appropriate information concerning public budgets, projects, procurement, legislation, service performance, and administrative decisions.

4.8 Haitian Ownership

Haiti's digital infrastructure must be governed in Haiti's national interest and supported by trained Haitian professionals. International partnerships may assist, but Haiti must retain authority over public systems and national data.

4.9 Resilience

Systems must be designed to continue operating during natural disasters, network interruptions, civil emergencies, and infrastructure failures.

4.10 Phased Transformation

The initiative will not attempt to digitize the entire country at once. Each phase must produce practical value, measurable outcomes, and reusable infrastructure.

5. The Haiti Digital Ecosystem

5.1 HaitiOS

HaitiOS is the proposed shared digital foundation. It is not a consumer operating system; it is the architectural layer through which approved government platforms use common digital capabilities.

- Digital identity
- Authentication
- Role-based access control
- API management
- Secure data exchange
- Government cloud services
- Notifications
- Document verification
- Digital signatures
- Payment integration
- Audit logging
- Geographic information services
- Data standards
- Developer tools
- System monitoring
- Disaster recovery
- Cybersecurity controls

5.2 HaitiGov

HaitiGov is the central public-service and government-information platform. It provides a unified entry point for citizens, residents, businesses, visitors, and diaspora members.

- Government directory

- Ministry and agency portals
- Citizen services
- Business services
- Laws and regulations
- Public forms
- Appointments
- Application tracking
- Government announcements
- Emergency notices
- Public consultations
- Complaints and feedback
- Public documents
- National projects
- Transparency tools

5.3 My Haiti Citizen Portal

My Haiti is the proposed secure citizen account and personal service dashboard.

- Personal identity profile
- Civil-status records
- Birth certificate requests
- Marriage records
- Passport applications
- Driver's-license services
- Tax information
- Education records
- Professional licenses
- Business registrations
- Property-related services
- Government appointments
- Application status
- Official notifications
- Digital documents
- Government payments
- Service history
- Consent and data-access records

5.4 Haiti Digital Identity

A secure national digital identity enables people to prove who they are without exposing all personal information to every institution.

- Unique identity reference
- Secure login
- Multi-factor authentication
- Identity verification

- Digital credentials
- Document verification
- Digital signatures
- Consent management
- Identity recovery
- Fraud prevention
- Family or guardian relationships where authorized
- Institutional employee identities
- Business identities
- Professional identities

A digital identity must not become a tool for uncontrolled surveillance. Identity verification must remain separate from unrestricted access to a person's complete records.

5.5 Haiti Data Exchange

Haiti should not operate through one unrestricted database that every institution can access. The initiative should establish a federated national data architecture.

- Institutions remain responsible for their official records.
- Shared national registries serve clearly defined functions.
- Information is exchanged through secure APIs.
- Access is based on purpose and authorization.
- Every access request is logged.
- Sensitive data is compartmentalized.
- Institutions receive only the information required for a service.
- Citizens can review certain access and consent records where legally appropriate.

The exchange may connect civil registry, tax administration, education, health, justice, immigration, customs, police, transportation, social protection, land and property, business registration, agriculture, local government, national statistics, and emergency management.

6. Government Structure Within the Platform

The digital ecosystem should reflect Haiti's constitutional and administrative institutions rather than copying the United States system directly. The U.S. structure may provide inspiration, but HaitiGov must be adapted to Haitian law, terminology, public administration, and national realities.

6.1 Executive Institutions

- Office of the President
- Office of the Prime Minister
- Council of Ministers
- Ministries
- Secretariats of State
- Autonomous government agencies
- Public authorities

- National commissions

6.2 Legislative Institutions

- Senate, when constitutionally operational
- Chamber of Deputies, when constitutionally operational
- National Assembly
- Legislative documents
- Proposed laws
- Adopted laws
- Public hearings
- Voting records where legally publishable

6.3 Judicial Institutions

- Court of Cassation
- Courts of Appeal
- Courts of First Instance
- Specialized courts
- Judicial administration
- Case-information services where legally permitted
- Legal-aid information
- Court schedules
- Electronic filing in future phases

6.4 Independent and Oversight Institutions

- Electoral authorities
- Anti-corruption institutions
- Audit and public-account institutions
- Human-rights institutions
- Regulatory authorities
- National statistics institutions
- Data-protection authority
- Public procurement authority
- National archives

7. Ministry and Agency Portals

Each ministry or agency should operate through a dedicated digital portal using the shared HaitiGov design system and national infrastructure.

A standard institutional portal may contain:

- Official mandate
- Leadership
- Organizational structure
- Services

- Forms
- Laws and regulations
- Programs
- Projects
- Budget information
- Procurement notices
- Public reports
- News
- Contact information
- Regional offices
- Service-performance indicators
- Open-data resources
- Citizen feedback

Possible institutional portals include:

- Foreign Affairs
- National Defense
- Justice and Public Security
- Economy and Finance
- Planning and External Cooperation
- Interior and Territorial Communities
- Public Works, Transportation and Communications
- National Education and Professional Training
- Public Health and Population
- Agriculture, Natural Resources and Rural Development
- Commerce and Industry
- Social Affairs and Labor
- Environment
- Tourism
- Culture and Communication
- Women's Affairs and Women's Rights
- Youth, Sports and Civic Action
- Haitians Living Abroad
- Digital Transformation and Public Innovation

The final structure should follow the lawful organization of the Haitian government at the time of implementation.

8. Department and Commune Digital Portals

Every Haitian department should have a digital presence within the ecosystem.

1. Artibonite
2. Centre
3. Grand'Anse
4. Nippes

5. Nord
6. Nord-Est
7. Nord-Ouest
8. Ouest
9. Sud
10. Sud-Est

Each department portal may include:

- Department overview
- Capital and major cities
- Arrondissements
- Communes
- Communal sections
- Departmental leadership
- Public institutions
- Government services
- Schools
- Hospitals and clinics
- Police and emergency services
- Infrastructure
- Roads and transportation
- Agriculture
- Economic activity
- Cultural identity
- Historical sites
- Tourism
- Public projects
- Local notices
- Disaster information
- Department statistics
- Investment opportunities

Each commune may eventually receive a connected portal for civil services, local permits, market administration, waste management, local taxes and fees, public works, community notices, complaints, emergency communication, participatory planning, and local project tracking.

9. HaitiExplore

HaitiExplore is the cultural, geographic, tourism, heritage, and international-discovery layer of the initiative. Its role is to present Haiti through Haitian history, Haitian communities, Haitian institutions, and verified local knowledge.

- Departments
- Cities
- Communes
- Villages

- Beaches
- Rivers
- Mountains
- Waterfalls
- Forts
- Monuments
- Museums
- Sacred and religious sites
- Historical locations
- National parks
- Cultural centers
- Markets
- Restaurants
- Hotels
- Local guides
- Artisans
- Festivals
- Regional foods
- Music
- Oral traditions
- Languages and expressions
- Historical biographies
- Investment and development opportunities

Its purpose is not only tourism promotion. It is also a national cultural archive and educational platform.

10. Cultural DNA of Haiti

Each department and community should be represented through its unique identity.

- Local traditions
- Oral history
- Proverbs
- Regional expressions
- Food specialties
- Agricultural products
- Music
- Dance
- Festivals
- Religious traditions
- Historical memory
- Clothing
- Architecture
- Craftsmanship

- Storytelling
- Local heroes
- Revolutionary history
- Migration history
- Diaspora connections
- Environmental identity

This information should be produced with historians, universities, cultural organizations, local leaders, artists, archivists, and community members. Local communities must participate in how their culture is documented.

11. Hidden Haiti

Hidden Haiti is a discovery feature designed to document valuable places that may be absent from major international mapping and tourism platforms.

- Lesser-known waterfalls
- Remote beaches
- Historic ruins
- Fortifications
- Mountain viewpoints
- Local markets
- Traditional communities
- Cultural gathering places
- Ecological sites
- Community museums
- Agricultural experiences
- Local food destinations

Locations may be classified as Verified Heritage Site, Hidden Gem, Community Experience, Adventure Location, Ecological Area, Cultural Site, Endangered Site, or Restricted or Protected Location.

Sensitive cultural, ecological, archaeological, or sacred locations should not be publicly exposed without local authorization and appropriate protection.

12. HaitiXR

HaitiXR is the immersive reality and virtual-experience platform. Its purpose is to allow people to experience Haiti remotely and encourage them to learn, visit, reconnect, invest, study, or support local communities.

12.1 Initial Experience

- 360-degree video
- Drone footage
- Interactive panoramas

- Guided virtual tours
- Narrated historical experiences
- Clickable information points
- Department tours
- Cultural events
- Museum experiences
- School learning modules
- Virtual heritage preservation

12.2 Future Experience

- WebXR
- Meta Quest
- Apple Vision Pro
- Immersive classrooms
- Digital reconstructions
- Historical reenactments
- Virtual museums
- Interactive tourism planning
- Digital twins of selected sites
- Virtual cultural festivals

12.3 Positioning

When you cannot travel to Haiti, Haiti can come to you.

HaitiXR must be built around meaningful storytelling rather than novelty. Its success depends on accurate history, high-quality production, local participation, and respect for cultural heritage.

13. HaitiAI

HaitiAI is the proposed public artificial-intelligence assistant for the digital ecosystem. It may support Haitian Creole, French, English, and Spanish.

- Find government services
- Understand administrative requirements
- Complete forms
- Locate offices
- Track applications
- Learn about laws
- Explore Haiti
- Plan travel
- Learn Haitian history
- Access educational content
- Find emergency information
- Navigate cultural and tourism resources

- Access agricultural guidance from approved sources
- Understand government announcements

HaitiAI must clearly distinguish official government information, general educational information, AI-generated guidance, and decisions requiring a human official.

It must not issue legal approvals, government credentials, immigration decisions, court judgments, medical diagnoses, or other official determinations unless a lawful and specifically authorized system is designed for that purpose.

14. Internal Intelligence and Security

A separate protected system may provide authorized government personnel with:

- Fraud detection
- Cybersecurity monitoring
- Service availability monitoring
- Duplicate-record detection
- Identity-risk analysis
- Public-service analytics
- Infrastructure monitoring
- Emergency coordination
- Data-quality alerts
- Compliance monitoring
- Security incident management
- Audit review

Public AI and internal government intelligence systems must remain technically and legally separated.

15. National Geographic Information System

The Haiti National GIS will provide the geographic foundation for government planning and public information.

- Administrative boundaries
- Departments
- Arrondissements
- Communes
- Communal sections
- Roads
- Bridges
- Ports
- Airports
- Schools
- Hospitals
- Police stations

- Fire and emergency services
- Government offices
- Water infrastructure
- Electricity infrastructure
- Telecommunications
- Agricultural land
- Rivers
- Watersheds
- Flood zones
- Seismic risk
- Landslide risk
- Emergency shelters
- Population distribution
- Land parcels where legally authorized
- Cultural and historical sites
- Tourism assets
- Public projects

Different information layers require different access permissions. Sensitive infrastructure and security information must not automatically be made public.

16. Open Government and Transparency

The initiative should establish a public transparency portal containing legally publishable information such as:

- National budget
- Ministry budgets
- Public procurement
- Contract awards
- Government projects
- Project locations
- Project status
- Funding sources
- Public audits
- Institutional reports
- Laws and regulations
- Public consultations
- Service-performance indicators
- Open datasets
- Government directories
- Public meeting information
- Citizen feedback statistics

A Rebuild Haiti Dashboard may display project name, responsible institution, location, purpose, funding source, budget, contractor, dates, status, images, milestones, audit information, and community feedback.

17. Economic and Business Services

- Online business registration
- Business verification
- Professional licensing
- Tax registration
- Permit applications
- Customs services
- Export and import information
- Government procurement registration
- Business directories
- Investment information
- Local supplier discovery
- Tourism listings
- Agriculture marketplaces
- Digital invoicing standards
- Government payment services
- Business-data interoperability

The initiative should lower administrative barriers while preserving legal, financial, and regulatory controls.

18. KobKlein Integration

KobKlein may serve as one of the authorized financial-technology integration partners, subject to all applicable laws, licenses, institutional approvals, regulatory requirements, security reviews, and public procurement rules.

- Government service payments
- Permit fees
- License fees
- Tax payments
- Tourism bookings
- Payments to verified local guides
- Merchant payments
- Approved government disbursements
- Diaspora-supported development contributions
- Digital receipts
- Payment confirmation APIs

KobKlein must not be presented as Haiti's official national payment system without formal governmental and regulatory authorization. The public platform should remain capable of integrating multiple approved banks and payment providers.

19. Education and Digital Knowledge

- School resources
- Teacher resources
- Haitian history
- Civic education
- Government education
- Digital literacy
- Cybersecurity awareness
- Professional training
- University resources
- Vocational education
- Public-service training
- Cultural education
- Agricultural education
- Diaspora learning
- HaitiXR classroom experiences

Educational records and learning content must remain distinct systems with different access controls.

20. Digital Health

- Health-facility directory
- Appointment requests
- Vaccination information
- Public-health announcements
- Telemedicine
- Maternal-health resources
- Emergency guidance
- Health-professional verification
- Medical supply tracking
- Disease-surveillance dashboards
- Secure patient portals
- Referral coordination

Medical records must be governed under strict confidentiality, access, retention, consent, and cybersecurity requirements. A general government database must not expose complete health information to unrelated institutions.

21. Emergency and Disaster Management

Because Haiti is highly exposed to natural disasters, emergency resilience must be a foundational capability.

- National emergency alerts
- Department and commune alerts
- Hurricane information
- Earthquake information
- Flood warnings
- Landslide warnings
- Shelter locations
- Missing-person reporting
- Emergency resource coordination
- Damage reporting
- Road-closure information
- Hospital availability
- Relief distribution tracking
- Diaspora emergency communication
- Offline-capable public information
- SMS and radio integration

The infrastructure must support continuity when internet and electricity access are disrupted.

22. National Cloud and Infrastructure

- Government-controlled infrastructure
- Secure cloud services
- Regional redundancy
- International disaster recovery
- Encrypted storage
- Content-delivery networks
- Secure network connections
- Identity infrastructure
- API gateways
- Monitoring systems
- Backup systems
- Security operations
- Data-loss prevention
- Infrastructure-as-code
- Automated recovery

No single physical location should become a national point of failure. Critical systems should have tested backup, failover, and restoration procedures.

23. Cybersecurity Framework

- Zero-trust access principles
- Multi-factor authentication
- Encryption in transit
- Encryption at rest
- Privileged-access management
- Role-based and attribute-based access
- Network segmentation
- API security
- Secure software development
- Vulnerability management
- Penetration testing
- Security logging
- Threat detection
- Incident response
- Disaster recovery
- Supply-chain security
- Employee security training
- Insider-risk controls
- Data classification
- Data-retention policies
- Independent security assessments
- Continuous compliance monitoring

A national Security Operations Center may eventually monitor authorized government systems.

24. Data Protection and Citizen Rights

- Notice of data collection
- Purpose of collection
- Access to personal information
- Correction of inaccurate information
- Protection against unauthorized access
- Review of certain automated decisions
- Complaint and appeal mechanisms
- Information about data sharing
- Appropriate consent controls
- Breach notification
- Data retention
- Identity recovery

A politically independent or legally protected data-protection authority should oversee compliance.

25. Governance Structure

25.1 Digital Transformation Council

Responsible for national direction, policy alignment, institutional participation, and strategic priorities.

25.2 Digital Public Infrastructure Authority

Responsible for shared platforms, standards, identity infrastructure, interoperability, security, and national technical operations.

25.3 Data Protection Authority

Responsible for privacy, data rights, complaints, enforcement, and independent oversight.

25.4 Cybersecurity Authority

Responsible for national government cybersecurity standards, incident coordination, and critical-system protection.

25.5 Institutional Digital Offices

Each ministry and agency should maintain an authorized digital office responsible for systems, data quality, service delivery, and compliance.

25.6 Department and Commune Digital Coordinators

Local coordinators should ensure that digital transformation reaches communities outside Port-au-Prince.

25.7 Public Advisory Council

The initiative should seek input from citizens, universities, civil society, technology professionals, businesses, women, youth, disability advocates, rural communities, diaspora organizations, and cultural institutions.

26. Technology Architecture

Experience Layer

- HaitiGov website
- Ministry websites
- Citizen portal
- Business portal
- Department portals
- Commune portals
- Mobile applications
- Kiosks

- Call centers
- SMS and USSD services
- HaitiExplore
- HaitiXR

Service Layer

- Identity
- Civil registration
- Notifications
- Documents
- Appointments
- Payments
- Applications
- Case management
- Search
- Maps
- Translation
- AI assistance
- Analytics

Integration Layer

- API gateway
- Service registry
- Event bus
- Data-exchange gateway
- Consent service
- Verification services
- Audit services

Data Layer

- Institutional databases
- National registries
- Document storage
- Geographic systems
- Public datasets
- Analytics platforms
- Archive systems

Security Layer

- Identity and access management
- Encryption
- Key management
- Security monitoring

- Fraud detection
- Data-loss prevention
- Threat protection
- Backup and recovery

Infrastructure Layer

- Government cloud
- Approved public cloud
- Data centers
- Edge services
- Content-delivery networks
- Secure networks
- Monitoring
- Disaster recovery

27. Developer Ecosystem

- API documentation
- Technical standards
- Design standards
- Software-development kits
- Sandbox environments
- Test identities
- Certification processes
- Security requirements
- Integration examples
- Developer support
- Application review
- Government open-source projects
- Public bug-reporting programs

Access to sensitive government APIs must require approval, contractual controls, security validation, and continuous monitoring.

28. Language and Accessibility

The ecosystem should prioritize Haitian Creole and French. English and Spanish may be provided for diaspora members, tourists, international partners, and regional accessibility.

- Mobile-first design
- Low-bandwidth mode
- Accessible typography
- Screen readers
- Keyboard navigation
- Captioning

- Audio guidance
- Simplified-language explanations
- Assisted-service centers
- SMS and USSD where appropriate

Haitian Creole should not be treated as a secondary translation added after development. It should be incorporated from the beginning.

29. Implementation Roadmap

Phase 0 - Legal, Institutional and Technical Foundation

- Stakeholder mapping
- Legal review
- Data-governance framework
- Digital identity feasibility study
- Cybersecurity baseline
- Government-system inventory
- National data inventory
- Architecture standards
- Institutional agreements
- Public consultation
- Funding strategy
- Pilot selection

Phase 1 - Public Information Foundation

- HaitiGov public website
- Government directory
- Ministry directory
- Department directory
- Laws and public documents
- Government announcements
- Public project directory
- HaitiExplore foundation
- Basic national map
- Creole and French support

Phase 2 - Shared Digital Infrastructure

- Identity and access platform
- API gateway
- Government design system
- Notification service
- Document-verification service
- Institutional developer portal
- Security monitoring

- Audit logging
- Government cloud foundation

Phase 3 - Pilot Citizen Services

- Birth-certificate requests
- Government appointments
- Business verification
- Public-service application tracking
- Professional-license verification
- School or diploma verification
- Government payment confirmation
- Local-service requests

Phase 4 - Department and Commune Expansion

- Department portals
- Commune portals
- Local project dashboards
- Emergency alerts
- Local business directories
- Infrastructure mapping
- Regional service centers

Phase 5 - Advanced Platforms

- My Haiti citizen portal
- Digital credentials
- Digital signatures
- HaitiAI
- National GIS expansion
- Open-data platform
- Integrated business services
- Health and education integrations
- HaitiXR

Phase 6 - National Scaling

- All ministries
- All departments
- Progressive commune coverage
- Diaspora services
- Mobile applications
- Kiosks
- Call-center integration
- National digital-literacy programs
- Independent audits

- Continuous modernization

30. Pilot Recommendation

The first pilot should remain focused and measurable.

- One department
- Two or three communes
- Three government institutions
- One shared identity service
- One document-verification service
- One payment-confirmation integration
- One public transparency dashboard
- One HaitiExplore cultural and tourism experience
- One HaitiXR demonstration location

The pilot should measure:

- Number of users
- Service-completion time
- Reduction in physical visits
- Citizen satisfaction
- System availability
- Security incidents
- Cost per transaction
- Data accuracy
- Institutional adoption
- Accessibility
- Creole-language usage

31. Funding and Partnerships

- Haitian government institutions
- Haitian universities
- Haitian technology companies
- Diaspora organizations
- Development banks
- International financial institutions
- United Nations agencies
- Regional organizations
- Cultural organizations
- Telecommunications providers
- Financial institutions
- Cybersecurity partners
- Cloud providers
- Civil-society organizations

Partnerships must protect Haitian sovereignty, citizen privacy, national data, competitive procurement, institutional continuity, technology portability, local workforce development, and long-term sustainability.

32. Sustainability

- National budget allocation
- Institutional service budgets
- Reasonable administrative fees
- Public-private partnerships
- Development funding
- Technical support contracts
- Shared government infrastructure savings
- Training programs
- Local technology workforce development
- Open standards
- Reduction of duplicate systems

Critical citizen services should remain accessible regardless of a person's ability to pay.

33. Measures of Success

- More citizens accessing services remotely
- Faster processing times
- Fewer repeated document submissions
- Greater Creole-language access
- Improved data accuracy
- Reduced administrative duplication
- Increased public transparency
- Better disaster communication
- More complete geographic information
- Increased visibility for Haitian culture and tourism
- Greater participation by departments and communes
- Increased trust in digital government
- Stronger cybersecurity
- More Haitian technology professionals employed
- Reduced dependency on disconnected foreign-built systems

34. Public Positioning

The initiative is:

- A proposed digital public-infrastructure initiative
- A long-term national modernization vision
- A modular technology and governance framework

- A citizen-centered public-service transformation
- A platform for government, culture, education, tourism, and economic participation

It should not be described as:

- The official platform of the Haitian government without authorization
- A replacement for constitutional institutions
- A private company's ownership of national identity
- One unrestricted database containing every citizen record
- A surveillance system
- A completed national platform before deployment
- The first or only initiative of its kind without independent verification

35. Official Public Description

The Haiti Digital Transformation Initiative is a proposed national digital-infrastructure program designed to connect citizens, government institutions, departments, communes, businesses, the diaspora, and public services through secure identity, interoperable technology, modern government platforms, trusted data exchange, and inclusive digital access.

The initiative brings together HaitiGov, HaitiOS, My Haiti, HaitiExplore, HaitiXR, HaitiAI, national GIS, open government, and shared digital services within one coordinated ecosystem.

Its objective is to make public services more accessible, improve institutional coordination, strengthen transparency, protect national information, preserve Haitian culture, support economic development, and help Haiti build the digital capabilities required for the future.

36. Public Slogan

Haiti Connected. Services Accessible. A Nation Moving Forward.

37. Foundational Declaration

The Haiti Digital Transformation Initiative is more than a website, application, or isolated technology project.

It is a commitment to building the digital foundations of a stronger Haitian state.

It recognizes that technology alone cannot solve political, economic, institutional, or social challenges.

However, when technology is combined with sound governance, legal protection, citizen participation, institutional accountability, cybersecurity, education, and national ownership, it can become a powerful instrument for public progress.

The initiative therefore seeks to create infrastructure that belongs to Haiti's future:

A future in which citizens are recognized.

A future in which services are accessible.

A future in which institutions can collaborate.

A future in which communities are visible.

A future in which Haitian culture is preserved.

A future in which the diaspora can reconnect.

A future in which government information is transparent.

A future in which public data is protected.

A future in which Haiti defines its own digital identity.

This is the foundation of the Haiti Digital Transformation Initiative.

This is Canon v1.0.

Source and Version Note

Canon v1.0 consolidates the Haiti Digital Transformation Initiative concept, the HaitiGov and HaitiExplore ecosystem, department and commune portals, HaitiXR, national digital identity, secure government data exchange, transparency, artificial intelligence, GIS, cybersecurity, accessibility, and phased implementation into one foundational project document.

This document is a proposed vision and planning framework. It does not represent official authorization or adoption by the Government of Haiti.
